

EPANET Model Context Protocol

Dennis Zanutto, Christos Michalopoulos and
Dragan Savic

Model Context Protocol

The Universal Connector for AI!

Standardized Interoperability

Replaces fragmented custom integrations with a unified JSON – RPC standard for AI models.

Architecture

Manages the communication between HOSTs (Apps), Clients (Connectors) and Serves (Services / Data sources)

Safety

Reduces hallucinations by providing secure, real-time access to fresh, local or remote contextual data.

EPANET MCP

With the developed tool, users can!

Run Simulations

Context-aware file selection from natural language, a high-level summary of hydraulic status and errors.

Modify the network

Modify pipe status, diameters, and topology; the server validates and maps the changes to the application.

Visualise results

Network representations and results charts (e.g. , nodal pressures or link velocities) for requirements-compliance monitoring.
